

Structure of this Paper

Introduction

Digital Twin and Predictive Maintenance: Trends and Evolution

Bibliometric Results Analysis

Digital Twin for Predictive Maintenance Software Development tools

Taxonomy of Application domains in Digital Twins for Predictive Maintenance

Marine Industry

Automobile Industry

Energy Industry

Hydro Industry

Aviation Industry

Railway Industry

Manufacturing Industry

Case Study

A Smart Aviation Application with Integrated Edge and Cloud Computing Environment

Hardware Components

Software Components

Experimental Validation

Discussion

Acknowledgement

Related Works

Methods

Architecture Overview of Digital Twin

Requirements

Real Time Maintenance Data Management

Quality of Service (QoS)

Scalability

Security

Integration of AI

Energy Consumption

Taxonomy of Digital Twin Algorithms for Predictive Maintenance in Industrial Engineering

Challenges and Research Direction

High-Fidelity Modeling and Real-Time Data Integration

Data Management and Analytics

Unified Development Framework and Tools

Cybersecurity and Privacy Concerns

Environmental Coupling Technologies

Conclusion and Future Works
